

BUILDING A PREDICTIVE MODEL

AN EXAMPLE OF A PRODUCT
RECOMMENDATION ENGINE

Alex Lin
Senior Architect
Intelligent Mining
alin@intelligentmining.com

Outline

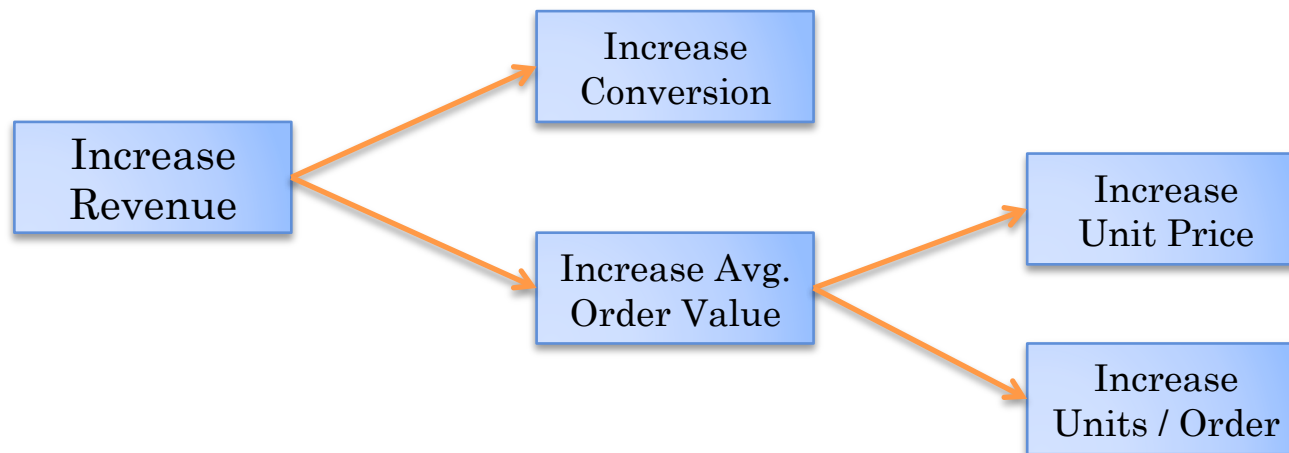

- Predictive modeling methodology
- k-Nearest Neighbor (kNN) algorithm
- Singular value decomposition (SVD) method for dimensionality reduction
- Using a synthetic data set to test and improve your model
- Experiment and results

The Business Problem

- Design product recommender solution that will increase revenue.

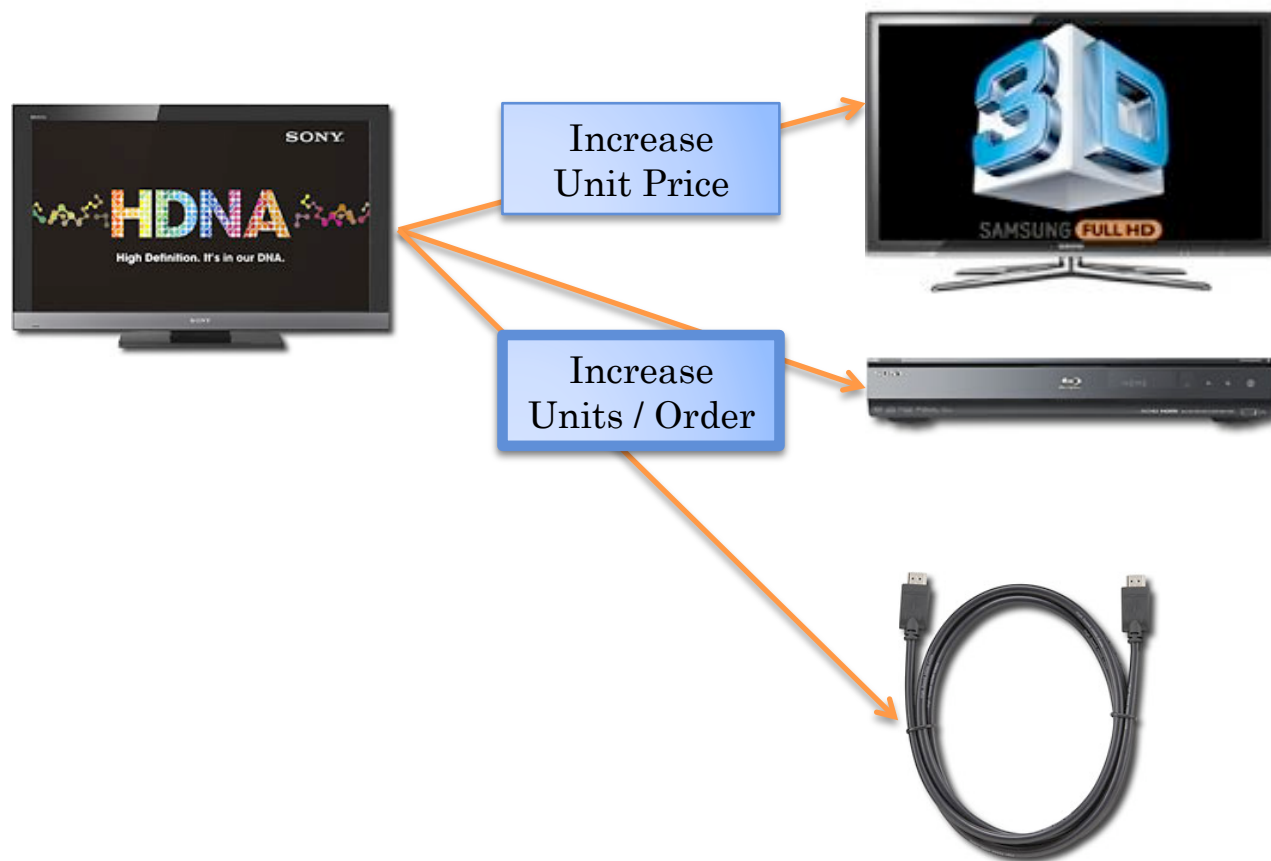

How Do We Increase Revenue?

Example

- Is this recommendation effective?

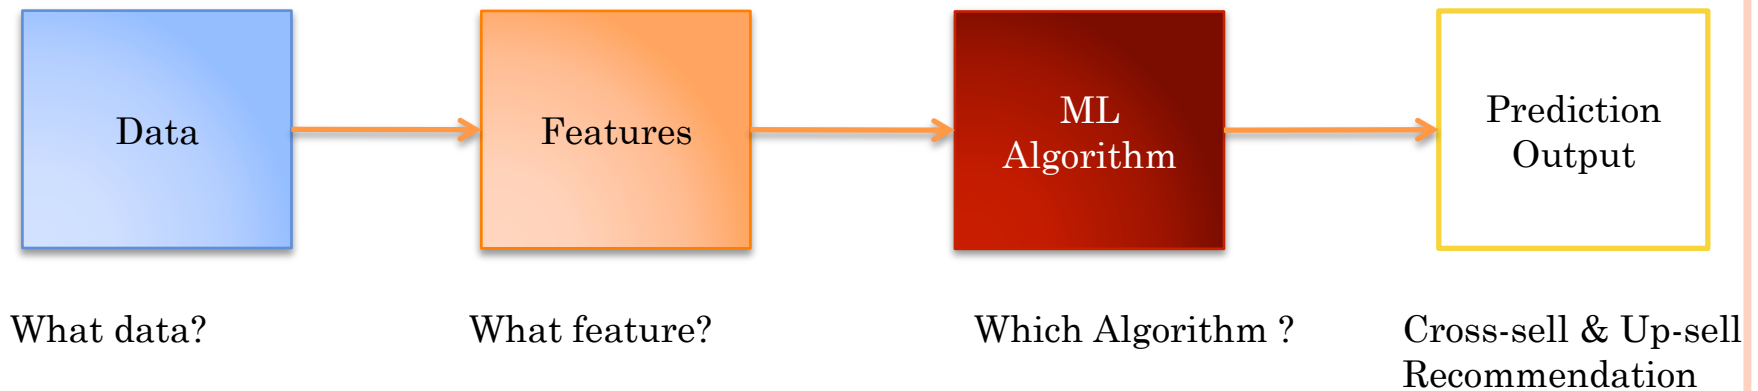

What am I
going to do?

Predictive Model

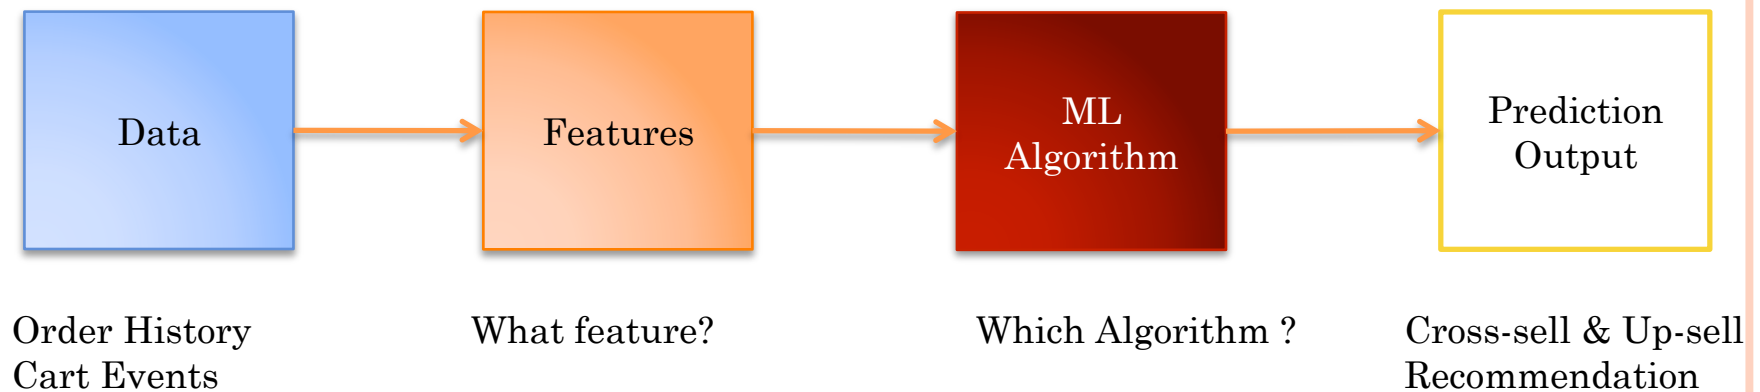

○ Framework

What Data to Use?

- Explicit data
 - Ratings
 - Comments
- Implicit data
 - Order history / Return history
 - Cart events
 - Page views
 - Click-thru
 - Search log
- In today's talk we only use Order history and Cart events

Predictive Model

What Features to Use?

- We know that a given product tends to get purchased by customers with similar tastes or needs.
- Use user engagement data to describe a product.

| | | users | | | | | | | | | | | |
|------------------------|----|-------|---|-----|---|---|-----|---|---|---|-----|-----|---|
| item | 17 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | ... | n |
| | | 1 | | .25 | | | .25 | | 1 | | .25 | | |
| user engagement vector | | | | | | | | | | | | | |

Data Representation / Features

- When we merge every item's user engagement vector, we got a $m \times n$ item-user matrix

| | | users | | | | | | | | | | | |
|-------|---|-------|-----|-----|-----|---|---|-----|-----|---|-----|-----|---|
| | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | ... | n |
| items | 1 | 1 | | .25 | | | 1 | | | | .25 | | |
| | 2 | | | | | | | .25 | | | | | |
| | 3 | 1 | | | .25 | | | | 1 | | | | |
| | 4 | | .25 | | | 1 | | | .25 | 1 | | | |
| | : | | | 1 | | | | 1 | | | | | |
| | m | | | | | | | | | | | | |

Data Normalization

- Ensure the magnitudes of the entries in the dataset matrix are appropriate

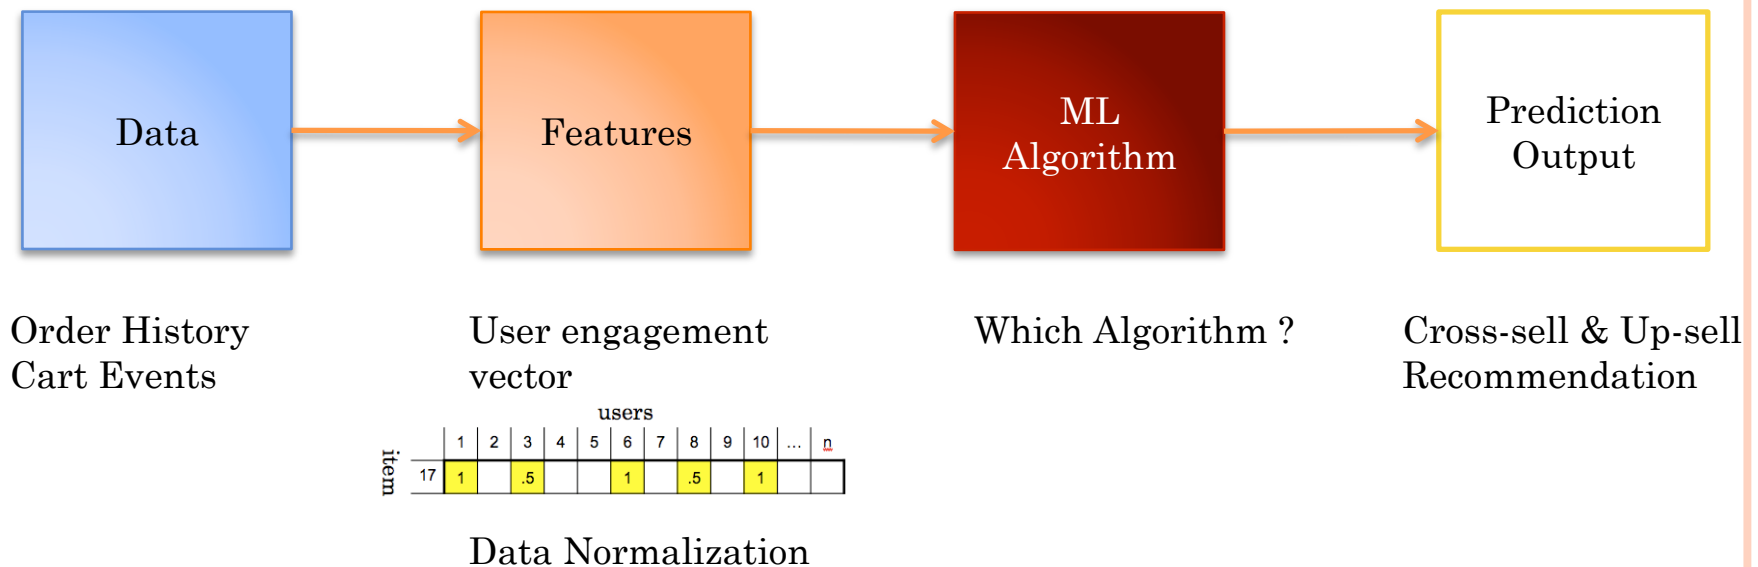

| | | users | | | | | | | | | | | |
|-------|---|-------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|
| | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | ... | n |
| items | 1 | .5 | | .9 | | | .92 | | | | .49 | | |
| | 2 | | | | | | | .79 | | | | | |
| | 3 | .67 | | | .46 | | | | .73 | | | | |
| | 4 | | .39 | | | .82 | | | .76 | .69 | | | |
| | ⋮ | | | .52 | | | | .8 | | | | | |
| | m | | | | | | | | | | | | |

- Remove column average – so frequent buyers don't dominate the model

Data Normalization

- Different engagement data points (Order / Cart / Page View) should have different weights
- Common normalization strategies:
 - Remove column average
 - Remove row average
 - Remove global mean
 - Z-score
 - Fill-in the null values

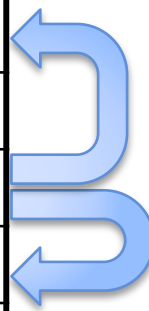

Predictive Model

Which Algorithm?

- How do we find the items that have similar user engagement data?

| | | users | | | | | | | | | | | |
|-------|----|-------|---|-----|---|-----|---|---|-----|---|-----|-----|---|
| | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | ... | n |
| items | 1 | 1 | | .25 | | | 1 | | | | 1 | | |
| | 2 | | | | | | | 1 | | | | | |
| | 17 | 1 | | | 1 | | 1 | | .25 | | .25 | | |
| | 18 | | 1 | | | .25 | 1 | | 1 | 1 | | | |
| | ⋮ | | | .25 | | | | 1 | | | | | |
| | m | | | | | | | | | | | | |

- We can find the items that have similar user engagement vectors with kNN algorithm

k-Nearest Neighbor (kNN)

- Find the k items that have the most similar user engagement vectors

| | | users | | | | | | | | | | | |
|-------|----------|-------|---|----|---|----|---|----|---|----|----|-----|---|
| | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | ... | n |
| items | 1 | .5 | | 1 | | | 1 | | | | 1 | | |
| | 2 | | 1 | | | | | .5 | | | 1 | | |
| | 3 | 1 | | | 1 | | | | 1 | 1 | | | |
| | 4 | | 1 | | | .5 | | 1 | | 1 | | | |
| | ⋮ | | | .5 | | | | 1 | | | | | |
| | m | | | | 1 | | | | | .5 | | | |

- Nearest Neighbors of Item **4** = [2,3,1]

Similarity Measure for kNN

| | | users | | | | | | | | | | | |
|-------|----------|-------|---|---|---|----|---|----|---|---|----|-----|---|
| | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | ... | n |
| items | 2 | | 1 | | | | | .5 | | | 1 | | |
| | 4 | | 1 | | | .5 | | 1 | | 1 | | | |

- Jaccard coefficient:

$$sim(a,b) = \frac{(1+1)}{(1+1+1) + (1+1+1+1) - (1+1)}$$

- Cosine similarity:

$$sim(a,b) = \cos(\vec{a}, \vec{b}) = \frac{\vec{a} \cdot \vec{b}}{\|\vec{a}\|_2 * \|\vec{b}\|_2} = \frac{(1*1 + 0.5*1)}{\sqrt{(1^2 + 0.5^2 + 1^2)} * \sqrt{(1^2 + 0.5^2 + 1^2 + 1^2)}}$$

- Pearson Correlation:

$$corr(a,b) = \frac{\sum_i (r_{ai} - \bar{r}_a)(r_{bi} - \bar{r}_b)}{\sqrt{\sum_i (r_{ai} - \bar{r}_a)^2} \sqrt{\sum_i (r_{bi} - \bar{r}_b)^2}} = \frac{m \sum a_i b_i - \sum a_i \sum b_i}{\sqrt{m \sum a_i^2 - (\sum a_i)^2} \sqrt{m \sum b_i^2 - (\sum b_i)^2}}$$

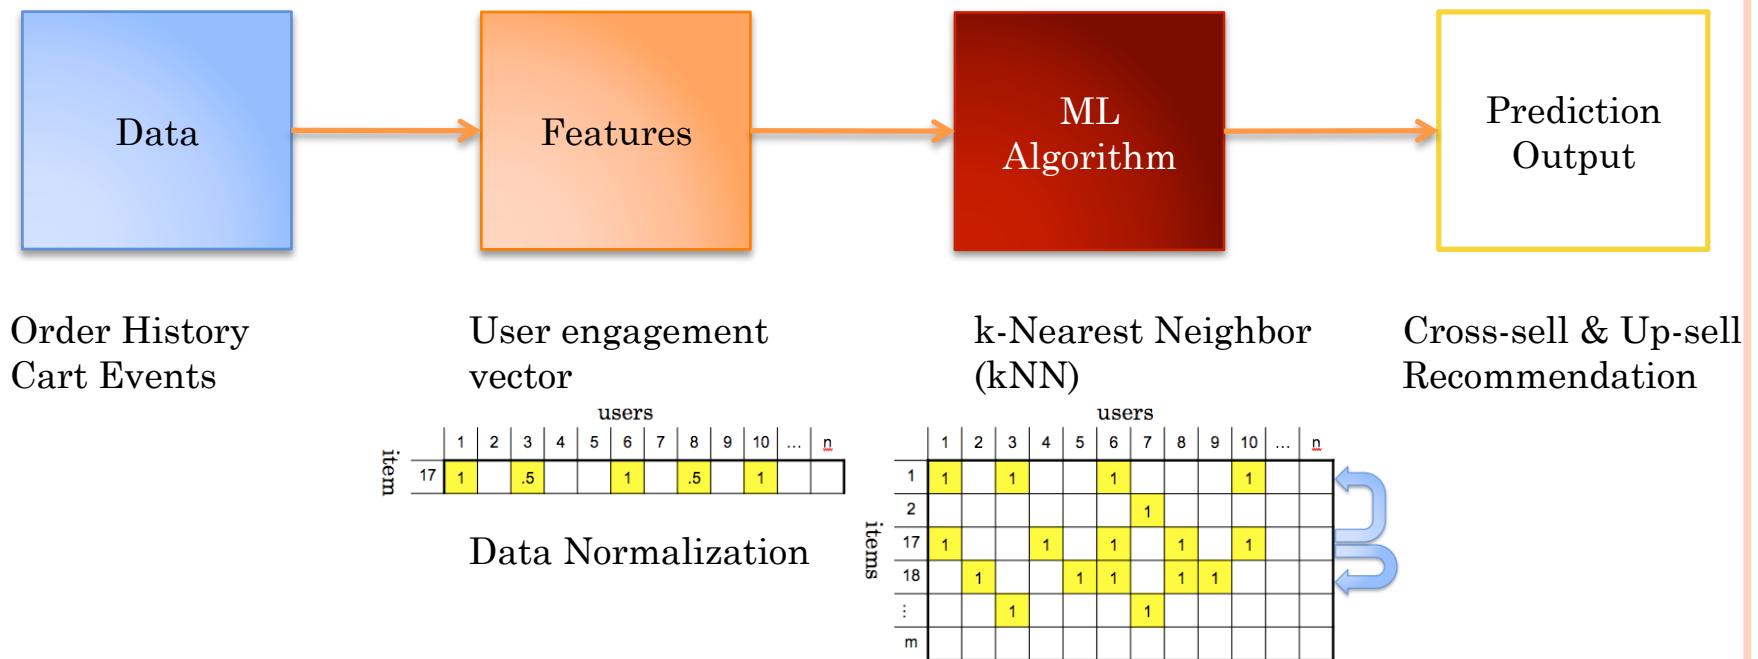

$$= \frac{match_cols * Dotprod(a,b) - sum(a) * sum(b)}{\sqrt{match_cols * sum(a^2) - (sum(a))^2} \sqrt{match_cols * sum(b^2) - (sum(b))^2}}$$

k-Nearest Neighbor (kNN)

Predictive Model

- Ver. 1: kNN

Cosine Similarity – Code fragment

```
long i_cnt = 100000; // number of items 100K
long u_cnt = 2000000; // number of users 2M
double data[i_cnt][u_cnt]; // 100K by 2M dataset matrix (in reality, it needs to be malloc allocation)
double norm[i_cnt];
```

```
// assume data matrix is loaded
```

```
.....
```

```
// calculate vector norm for each user engagement vector
```

```
for (i=0; i<i_cnt; i++) {
    norm[i] = 0;
    for (f=0; f<u_cnt; f++) {
        norm[i] += data[i][f] * data[i][f];
    }
    norm[i] = sqrt(norm[i]);
}
```

```
// cosine similarity calculation
```

```
for (i=0; i<i_cnt; i++) { // loop
    for (j=0; j<i_cnt; j++) { // loop
        dot_product = 0;
        for (f=0; f<u_cnt; f++) { // loop thru entire user space 2M
            dot_product += data[i][f] * data[j][f];
        }
        printf("%d %d %lf\n", i, j, dot_product/(norm[i] * norm[j]));
    }
}
```

```
// find the Top K nearest neighbors here
```

```
.....
```

1. 100K rows x 100K rows x 2M features --> scalability problem
kd-tree, Locality sensitive hashing,
MapReduce/Hadoop, Multicore/Threading, Stream Processors
2. data[i] is high-dimensional and sparse, similarity measures
are not reliable --> accuracy problem
This leads us to The SVD dimensionality reduction !

Singular Value Decomposition (SVD)

$$A = U \times S \times V^T$$

$$A_k = U_k \times S_k \times V_k^T$$

- Low rank approx. Item profile is $U_k * \sqrt{S_k}$
- Low rank approx. User profile is $\sqrt{S_k} * V_k^T$
- Low rank approx. Item-User matrix is $U_k * \sqrt{S_k} * \sqrt{S_k} * V_k^T$

Reduced SVD

$$A_k = U_k \times S_k \times V_k^T$$

- Low rank approx. Item profile is $U_k * \sqrt{S_k}$

SVD Factor Interpretation

- Singular values plot (rank=512)

[illegible]

Missing values

| item | users | | | | | | | | | | | |
|------|-------|---|----|---|---|---|---|----|---|----|-----|----------|
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | ... | <u>n</u> |
| 17 | 1 | | .5 | | | 1 | | .5 | | 1 | | |

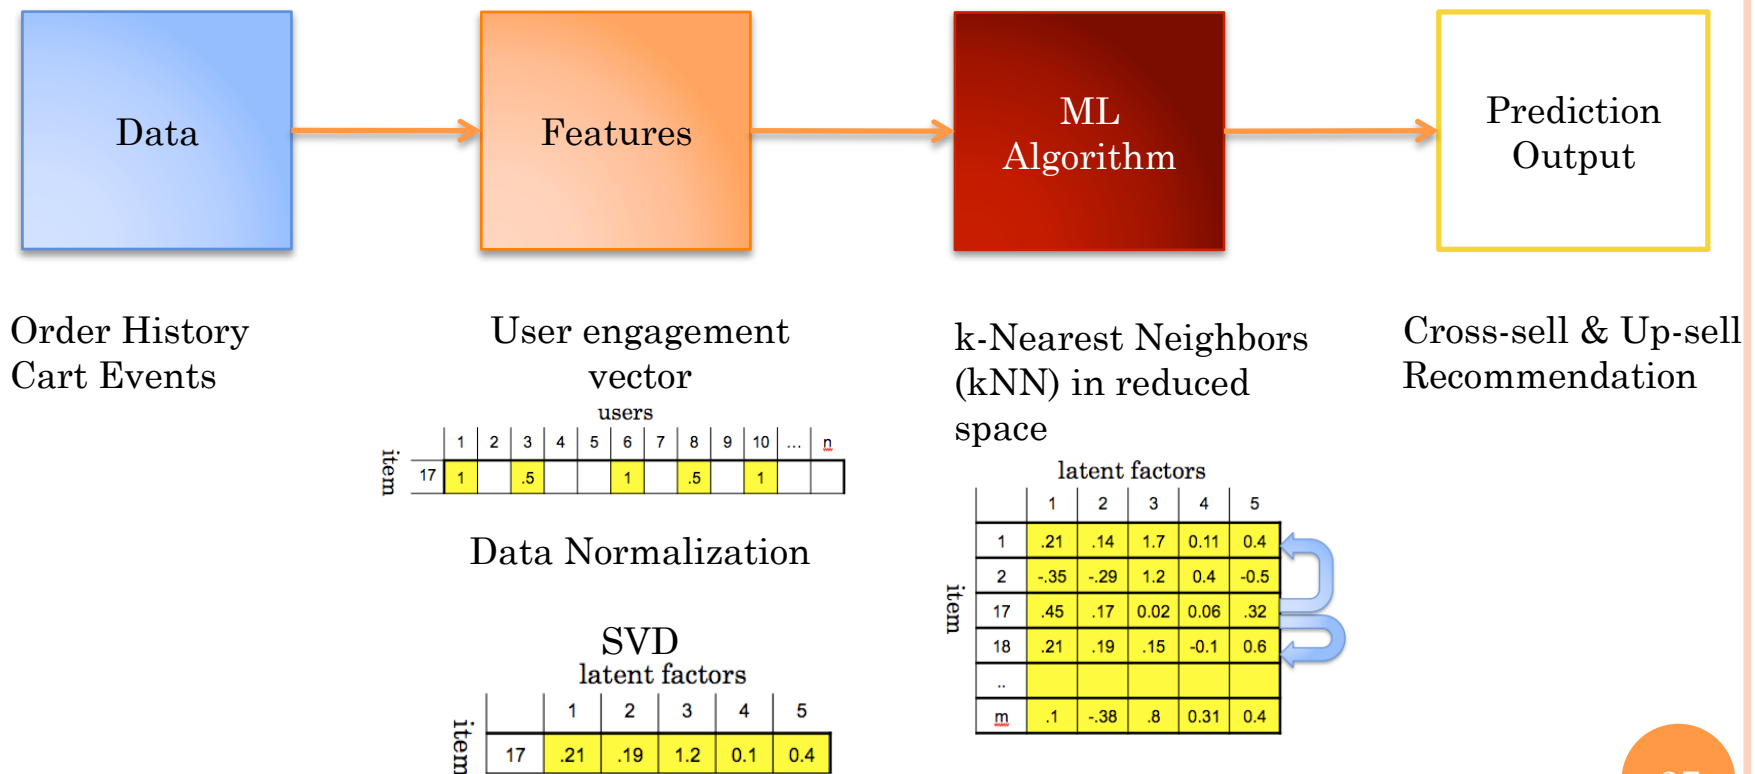

- Difference between “0” and “unknown”
- Missing values do NOT appear randomly.
- Value = (Preference Factors) + (Availability) – (Purchased elsewhere) – (Navigation inefficiency) – etc.
- Approx. Value = (Preference Factors) +/- (Noise)
- Modeling missing values correctly will help us make good recommendations, especially when working with an extremely sparse data set

Singular Value Decomposition (SVD)

- Use SVD to reduce dimensionality, so neighborhood formation happens in reduced user space
- SVD helps model to find the low rank approx. dataset matrix, while retaining the critical latent factors and ignoring noise.
- Optimal low rank needs to be tuned
- SVD is computationally expensive
- SVD Libraries:
 - Matlab $[U, S, V] = \text{svds}(A, 256);$
 - SVDPACKC <http://www.netlib.org/svdpack/>
 - SVDLIBC <http://tedlab.mit.edu/~dr/SVDLIBC/>
 - GHAPACK <http://www.dcs.shef.ac.uk/~genevieve/ml.html>

Predictive Model

○ Ver. 2: SVD+kNN

Synthetic Data Set

- Why do we use synthetic data set?

- So we can test our new model in a controlled environment

Synthetic Data Set

- 16 latent factors synthetic e-commerce data set

- Dimension: 1,000 (items) by 20,000 (users)
- 16 user preference factors
- 16 item property factors (non-negative)
- Txn Set: $n = 55,360$ sparsity = 99.72 %
- Txn+Cart Set: $n = 192,985$ sparsity = 99.03%
- Download: <http://www.IntelligentMining.com/dataset/>

| user_id | item_id | type |
|---------|---------|------|
| 10 | 42 | 0.25 |
| 10 | 997 | 0.25 |
| 10 | 950 | 0.25 |
| 11 | 836 | 0.25 |
| 11 | 225 | 1 |

Synthetic Data Set

| | | |

User preference factors
16 x 20K matrix

| | | | | | |
|--|---|--|--|--|--|
| | x | | | | |
| | y | | | | |
| | z | | | | |

items

Purchase Likelihood score
1K x 20K matrix

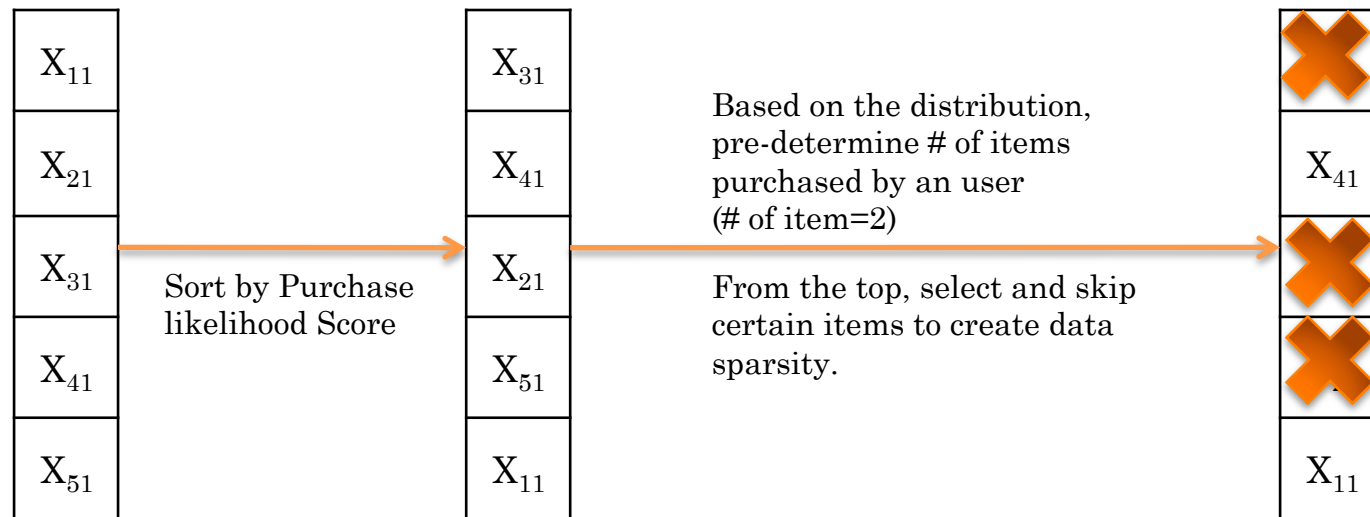

| | | | | | |
|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| X ₁₁ | X ₁₂ | X ₁₃ | X ₁₄ | X ₁₅ | X ₁₆ |
| X ₂₁ | X ₂₂ | X ₁₂ | X ₂₄ | X ₂₅ | X ₂₆ |
| X ₃₁ | X ₃₂ | X ₃₃ | X ₃₄ | X ₃₅ | X ₃₆ |
| X ₄₁ | X ₄₂ | X ₄₃ | X ₄₄ | X ₄₅ | X ₄₆ |
| X ₅₁ | X ₅₂ | X ₅₃ | X ₅₄ | X ₅₅ | X ₅₆ |

users

$$X_{32} = (a, b, c) \cdot (x, y, z) = a * x + b * y + c * z$$

X_{32} = Likelihood of Item 3 being purchased by User 2

Synthetic Data Set

- User 1 purchased Item 4 and Item 1

Experiment Setup

- Each model (Random / kNN / SVD+kNN) will generate top 20 recommendations for each item.
- Compare model output to the actual top 20 provided by synthetic data set
- Evaluation Metrics :
 - Precision %: Overlapping of the top 20 between model output and actual (higher the better)

$$\text{Precision} = \frac{|\{Found_Top20_items\} \cap \{Actual_Top20_items\}|}{|\{Found_Top20_items\}|}$$

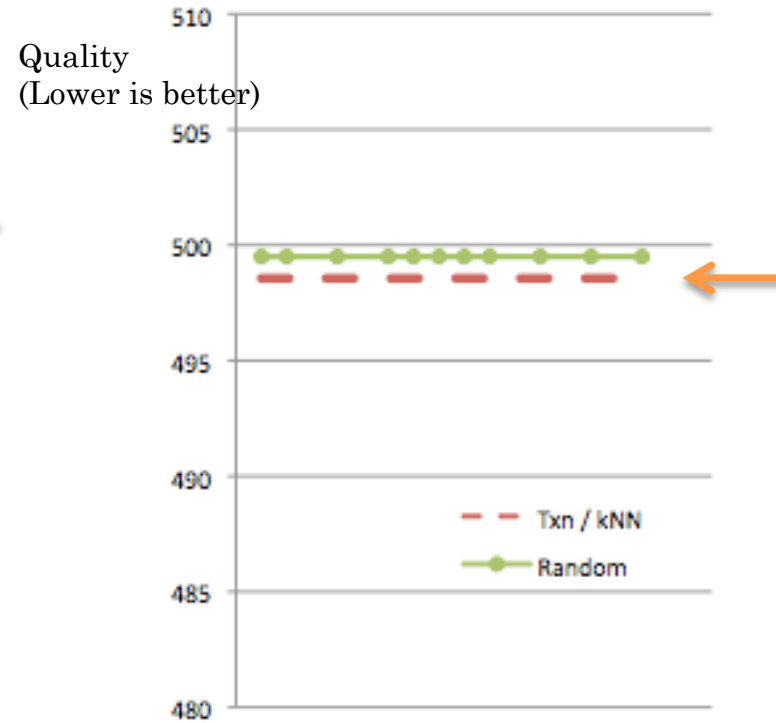

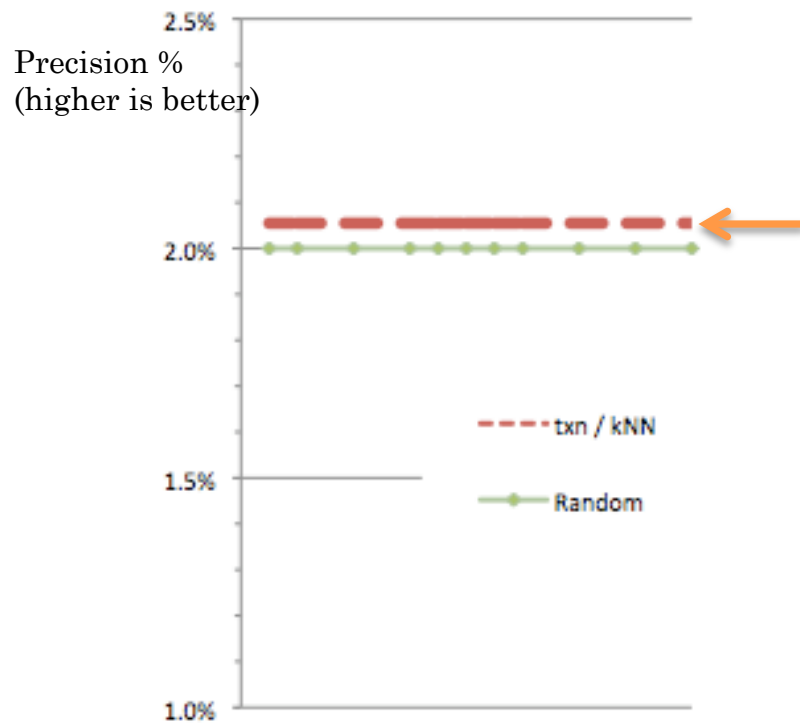

- Quality metric: Average of the actual ranking in the model output (lower the better)

| | | | | | |
|---|---|----|----|----|----|
| 1 | 2 | 30 | 47 | 50 | 21 |
|---|---|----|----|----|----|

| | | | | | |
|---|---|-----|----|-----|-----|
| 1 | 2 | 368 | 62 | 900 | 510 |
|---|---|-----|----|-----|-----|

Experimental Result

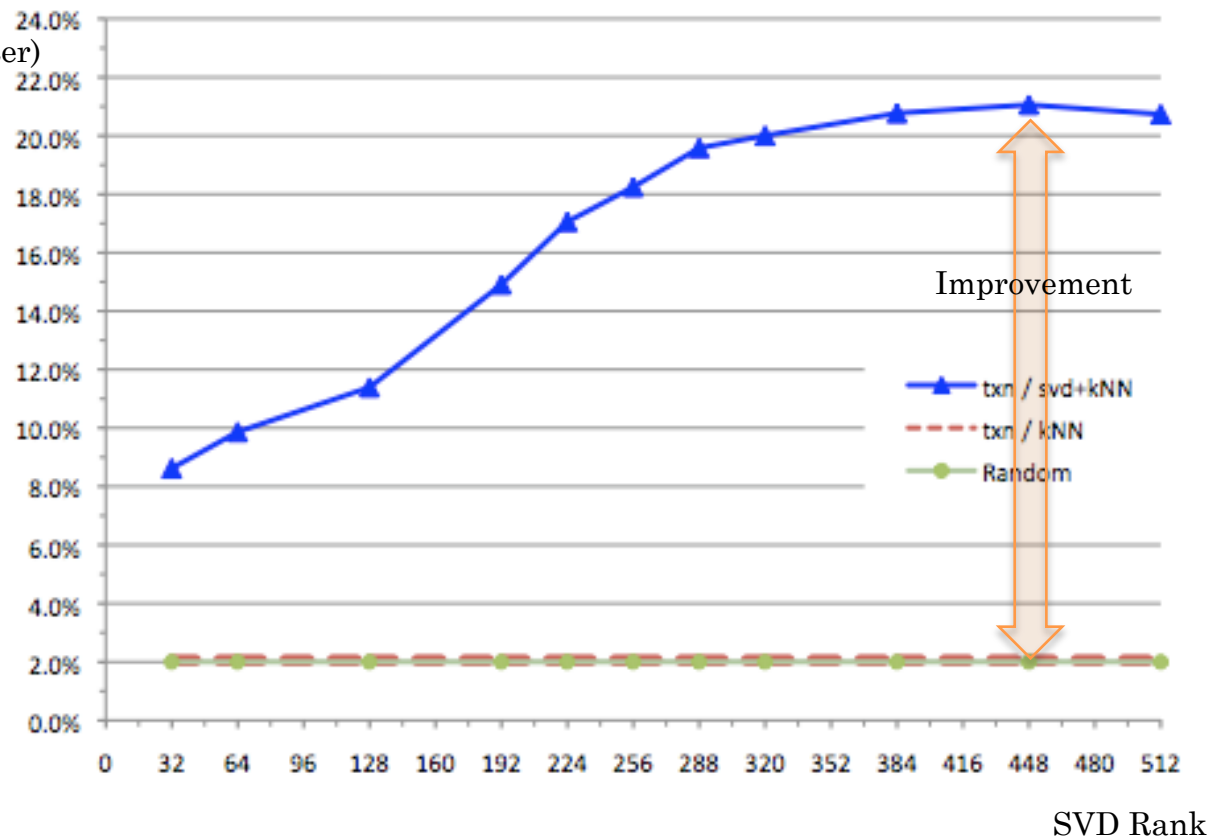

○ kNN vs. Random (Control)

Experimental Result

○ Precision % of SVD+kNN

Recall %
(higher is better)

Experimental Result

○ Quality of SVD+kNN

Quality
(Lower is better)

Experimental Result

- The effect of using Cart data

Experimental Result

- The effect of using Cart data

Outline

- Predictive modeling methodology
